

Scratch-resistant agent can be reapplied

RT-3806

Features and advantages:

This product is designed to improve the wear resistance and scratch resistance of resin after film formation, while controlling the surface tension of liquid material, promoting leveling, improving the surface smoothness and luster. This product is suitable for a variety of coating resin coatings, increase the surface smoothness and scratch resistance and anti-adhesion. Improves dust and spray acceptance and allows higher film thickness to remain on vertical surfaces.

1. Good compatibility and recoating
2. Containing active reaction groups, participating in the film formation reaction of polyurethane, amino baking paint and oxidation drying system
3. Good hydrophobic performance, anti-viscosity better than common silicone oil

Product parameter:

Appearance	Colorless to light transparent liquid
Effective portion	100%
Ingredient	Containing active group siloxane
Specific gravity	1.01 g/mg (25 ° C)

Application field:

Solvent-based coatings and ink systems, such as polyurethane, amino paint systems, thermoplastic acrylic resins, etc

Recommended dosage:

0.1-1.0% of the total formula

How to use:

It can be added at any stage of the production process

Packing:

25KG/ barrel, 200KG/ barrel
